Java Strings

Strings are used for storing text.

A **String** variable contains a collection of characters surrounded by double quotes:

Example

Create a variable of type **String** and assign it a value:

```
String greeting = "Hello";
```

String Length

A String in Java is actually an object, which contain methods that can perform certain operations on strings. For example, the length of a string can be found with the `length()` method:

Example

```
String txt = "ABCDEFGHJKLMNOPQRSTUVWXYZ";  
System.out.println("The length of the txt string is: " + txt.length());
```

[Try it Yourself »](#)

More String Methods

There are many string methods available, for example `toUpperCase()` and `toLowerCase()`:

Example

Finding a Character in a String

The `indexOf()` method returns the **index** (the position) of the first occurrence of a specified text in a string (including whitespace):

Example

```
String txt = "Please locate where 'locate' occurs!";  
System.out.println(txt.indexOf("locate")); // Outputs 7
```

Try it Yourself »

Java counts positions from zero.
0 is the first position in a string, 1 is the second, 2 is the third ...
